

Figure S1. Association of urine ACR with (a) allograft failure, (b) cardiovascular disease events, (c) all-cause mortality, and (d) the composite of allograft failure and all-cause mortality, based on multivariable-adjusted models plotted using restricted cubic splines. Dashed lines represent the 95% confidence interval. The p-value for linearity is  $>0.05$  for all models, suggesting that natural log transformed ACR appropriately represents the relationship between ACR and outcomes.

(a)  
Adjusted HR (95% CI)  
Dialysis

(b)

Adjusted HR (95% CI)

CVD

(c)

Adjusted HR (95% CI)

Mortality

(d)

Adjusted HR (95% CI)  
Dialysis or Mortality
